#### Consultation on risk proportionate approaches to clinical trial regulation

#### tel: +32 2 7416829 fax: +32 2 7347910

### Response from the European Association of Hospital Pharmacists

e-mail: sec@eahp.eu internet: www.eahp.eu

# Support for the intent within the consultation document

VAT No.: BE0836.539.876

EAHP supports the endeavours of the European Commission to facilitate more risk proportionate approaches to clinical trial regulation. The consultation document is correct to assert that many clinical trials pose only a minimal additional risk to subject safety compared to normal clinical practice. It follows therefore that approaches to clinical trial regulation should ideally be adapted to the risk to the subject of the research carried out.

## Support for the reflections on risk assessment within the consultation document

Rationales and reflections provided within the consultation document in respect to interpreting risk (e.g. lines 99-108) are supported by EAHP. For example, the IMP perspective alone does not determine whether a trial is low intervention; other factors such as trial design and patient population must be factored in. Equally, if a trial is not low intervention, this does not mean that risk proportionate procedures cannot or should not be applied.

## Interpreting "published scientific evidence"

As the consultation document sets out, the 2014 Clinical Trials Regulation stipulates that "published scientific evidence" be a factor in determining whether a proposed trial is "low intervention". The consultation document then expands on what can constitute "published scientific evidence.

lines 124-127: "The published scientific evidence supporting the safety and efficacy of an IMP which is not used in accordance with the terms of the marketing authorisation could include evidence based treatment guidelines and health technology assessment reports, and clinical trial data published in scientific peer-reviewed journals or other appropriate evidence."

EAHP suggests that marketing authorization granted in another country (e.g. USA) also be accepted as evidence.

### Risk identification and evaluation

EAHP suggest amendment to:

- Line 189, "The risk evaluation should must commence prior to the finalization of the protocol."
- Line 193, "The risk assessment and mitigation should must be described and implemented."
- Line 194, "The documentation should must include the rationale and responsible functions of any specific actions required (e.g monitor, investigator etc)
- Line 200, "Careful consideration should must also be given to the adequacy of the measures to protect the privacy of trial subjects"

#### Risk review

### EAHP suggest amendment to:

Line 227, "An ongoing reassessment of the risks should must be performed...

#### Risk communication

## EAHP suggest amendment to:

Line 235, "There should must be a process to ensure that the risk assessment and
mitigation plan and any subsequent updates, as well as any changes that may impact on
trial conduct e.g protocol amendments, serious breaches, safety reporting, protocol
deviations etc. are shared with the relevant personnel, including all healthcare
professionals involved with the trial.

#### Risk reporting

EAHP suggest amendment to:

 Line 241, "The sponsor should must describe the implemented risk adaptions in the clinical study report"

# Safety reporting

EAHP suggest amendment to:

- Line 246, "Any such adaptions should must be clearly stated and justified in the protocol"
- Line 251, "As a general rule, any adverse event considered by the investigator as being potentially related to the IMP, and therefore representing an adverse reaction, should must be reported to the sponsor"
- Line 262, "Risk adaptions to adverse event recording, collection and reporting should must be detailed in the risk assessment and mitigation plan"
- Line 288, "The risk assessment should must consider whether the clinical trial under evaluation includes a new population..."

#### Traceability and accountability

EAHP suggest amendment to:

Line 366, "Other risk factors, like the stability of the active ingredient that impact the
management of IMP should must also be considered in the risk assessment and for
example, temperature monitoring or light protection if applicable, should must be adapted
depending on the outcome of that risk assessment."
 New line after line 366: If stability or reconstitution could be a problem, pharmacists must
be involved in handling the IMP.
