Summary text

On the whole, Finnish respondents seem to be more positive emotionally than other Europeans. They are experiencing the positive emotions more frequently and the negative emotions less frequently than average. More Finnish respondents are experiencing all of the positive emotions 'all' or 'some of the time' than average and fewer respondents are experiencing all of the negative emotions 'never' or 'rarely'.

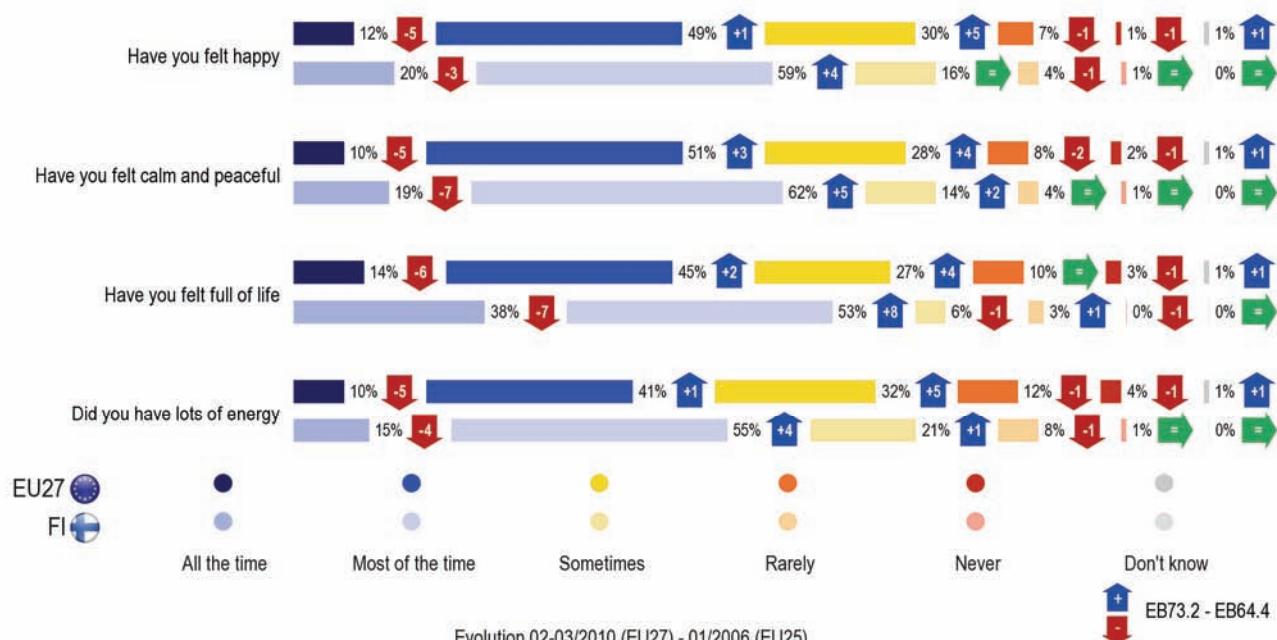

More Finnish respondents than average feel they have accomplished less than they would have liked because of a physical problem, with fewer stating that they have 'never' accomplished less than average (36% vs EU average of 41%). However, fewer Finnish respondents feel they have accomplished less as the result of an emotional problem, with almost six out of ten (59%) saying they 'never' accomplished less as the result of an emotional problem (compared to the EU average of 53%). The proportion who sought help from a professional in the past 12 months is the same as the EU average (14% sought help vs. EU average of 15%), which has increased significantly since 2006 (+4 percentage points).

The proportion of Finnish respondents taking antidepressants in the last 12 months is the same as the EU average (6% compared to the EU average of 7%). However, more Finnish respondents are taking them for depression (74%) than anxiety (34%), whereas on average across the EU antidepressants are taken equally for these conditions (depression 51% and anxiety 47%). In addition, Finnish respondents are taking antidepressants to enhance performance more than average (20% vs. EU average of 8%).

Finnish respondents appear to be more satisfied in their employment than other Europeans. They felt more satisfied than average on all three of the attributes measured.

1. The state of Mental Health

QD2. How often during the past 4 weeks...?
