## Summary text

Overall, Greek respondents appear to be less positive emotionally than average, they are experiencing the positive emotions less frequently and the negative emotions more frequently than average. They experienced the positive emotions of being 'happy', 'calm and peaceful' and having 'lots of energy' 'all' or 'most of the time' less than average (43%, 46% and 54% respectively vs. EU averages of 61%, 61% and 51%). In addition, more than average felt 'particularly tense' and 'tired' 'most of the time' (18% and 22% respectively vs. EU averages of 12% and 17%) and fewer than average felt 'down in the dumps', downhearted and depressed' and worn out' 'never' or 'rarely' (56%, 51% and 43% vs. EU averages of 74%, 66% and 47%).

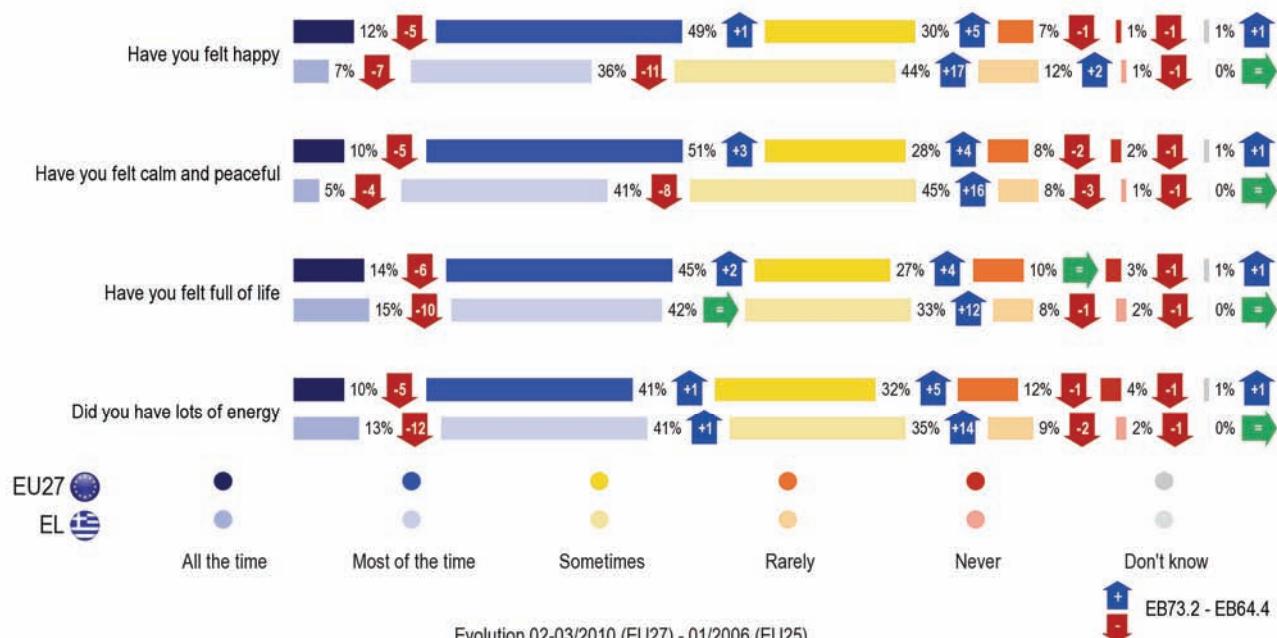

Overall, Greek respondents do not feel they have accomplished less because of a physical problem (43% 'never' vs. EU average of 41%). However, it appears that emotional problems have resulted in them accomplishing less than average (43% 'never' vs. 53% on average). More Greek respondents than average felt that an emotional problem had 'rarely' (28% vs. EU average of 20%) and 'sometimes' (22% vs. EU average of 18%) caused them to accomplish less. Nevertheless, fewer than average sought help from a professional in the past 12 months than average (7% vs. EU average of 15%), which has declined significantly since 2006 (-6 percentage points).

Furthermore, the proportion of Greek respondents taking antidepressants in the last 12 months was less than the EU average (only 3% vs. EU average of 7%). More Greek respondents took antidepressants for anxiety (54%) than depression (33%), whereas on average across Europe they are taken equally for depression and anxiety.

Greek respondents are most concerned about their job security, with about four out of ten (42%) agreeing that their job is under threat, compared to the average of a quarter (25%). They felt the same as other Europeans about their job reflecting their skills and recognition received at work.

## 1. The state of Mental Health
