Summary text

Emotionally, Portuguese respondents displayed both positive and negative differences to the EU averages. More Portuguese respondents than average 'never' or 'rarely' felt 'tense' and 'tired' (50% and 29% respectively vs. EU averages of 44% and 26%). However, contrary to feeling less tired than average, fewer respondents than average 'never' or 'rarely' felt 'worn out' (44% vs. average of 47%) and fewer had 'lots of energy' 'all' or 'most of the time' (48% vs. average of 51%). Furthermore, fewer respondents than average 'never' or 'rarely' felt 'down in the dumps' (70% vs. average of 74%) and fewer felt 'calm and peaceful' 'all' or 'most of the time' (55% vs. average of 61%).

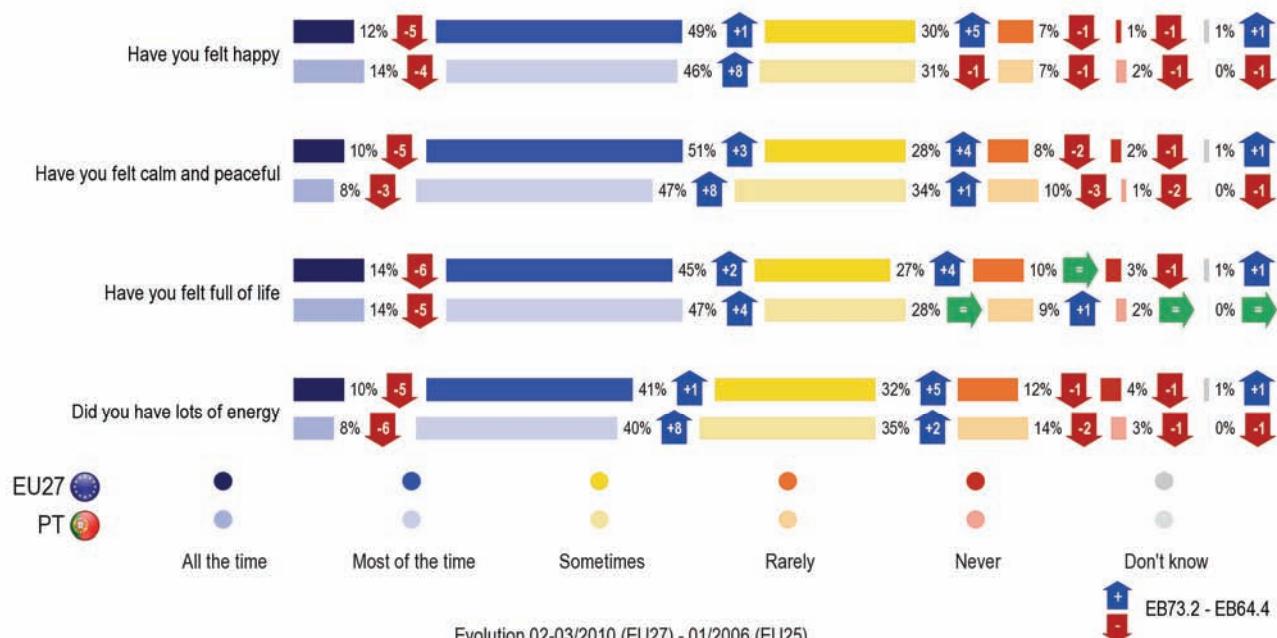

More Portuguese respondents than average felt they had not accomplished less as the result of a physical problem (45% vs. EU average of 41%). However, fewer than average felt they had not accomplished less as the result of an emotional problem (47% 'never' vs. average of 53%) and more than average feeling they 'rarely' accomplished less (27% vs. EU average of 20%). In addition, the proportion of Portuguese respondents who sought help in the past 12 months from a professional for a psychological or emotional problem has increased significantly since 2006 (+5 percentage points) to 21%, which is higher than the EU average (15%).

Furthermore, the proportion of Portuguese respondents taking antidepressants in the last 12 months is higher than the EU average (15% vs. EU average of 7%). More Portuguese respondents took antidepressants for depression (55%) than anxiety (41%), whereas across Europe they are taken almost equally for these conditions.

Nonetheless, absenteeism from work is lower than average amongst Portuguese respondents, with 88% not being absent at all in the past four weeks compared to 77% on average. In terms of attitudes to work, Portuguese respondents are most concerned about job security with more feeling their job is under threat than average (29% vs. EU average of 25%).
